Abstract of FR2659626

Device for carrying bags with handles at arm's length.

The invention relates to a device allowing several bags to be carried whilst eliminating pain and numbness due to poor distribution of loads and saving the user from multiple manipulations and, finally, allowing him to prevent the entire opening of the bags when placing them on the ground.

It is constituted by a body (1) having an orifice (2) where pivots a closure (3) which lodges in the notch (4), a grip (5) adapted to the fingers (8) and a release (6) making it possible to insert or withdraw the handles of the bags (7).

The device is particularly intended for carrying bags given to customers in supermarkets and other activities using this type of bags, thus allowing them easier and more practical carrying.
